

Mouth Mechanics - How Gate Clearance Works

Teaching version. Full code dump quarantined in reference/.

Source: [gate/app.py \(law\)](#) | [reference/04-app-mouth-excerpts.code-dump.pdf](#) | Undefined word? Open doc 18 (Layer 0 atoms) and define it before continuing.

TEACHING DOC. Code dump moved to study-pdfs/reference/. Do not confuse scrolling Python with owning the law. Undefined word? Open doc 18 (Layer 0 atoms) and define it before continuing.

Plain opener

Gate asks Velaru: is this path allowed right now? If the answer is no, broken, timed out, or unreadable - stop. If the answer is yes, Gate returns a permit. Gate still does not move the money. Another exclusive door (worker/weld) is the only place the write may run after permit.

Three jobs in the mouth

fail_closed: Timeouts and bad upstream answers become DENY/halt. Unreachable is never treated as LIVE.

velaru_fuse: All fuse questions go through that fail-closed client. Non-JSON / 5xx / timeout => halt.

run_welded_act (/v1/act): Returns whether the act may proceed. write_executed stays false from Gate. acted/clearance_allows means permit - not execution.

Law

Clearance is not execution. The exclusive edge is the only place the irreversible write may run after a valid permit.

What to hunt when you later open the code dump

- write_executed must stay false on Gate clearance paths
- halt / fail_closed / UNREACHABLE paths
- CHARGE mentioned as only DEAD -> LIVE path
- Demo routes vs welded closed-world routes

Retrieval drill

- Why can Gate say yes and money still not leave?
- What happens if Velaru times out?
- Name the three jobs above from memory.
